CSCI 420 Computer Graphics
Lecture 8

Shadows
Hierarchical Models

Projections and Shadows

Hierarchical Models

[Angel Ch. 8]

Oded Stein

University of Southern California

How is HW1 going?

- After last class, you should all have started working on HW1.
- HW1 is due Oct 7.
- **If you have not compiled your starter code yet, please see me in the break!**
- Ask questions on Piazza.
- Use the office hours if you need individual help.
- Good luck!

Roadmap

- Last lecture: Shaders
- Today:
  - Shadows via projections
  - Hierarchical models
- Next: Polygonal Meshes, Curves and Surfaces
- Goal: background for Assignment 2
  - (specifically curves)

Importance of shadows

What is the difference between the 3 balls?

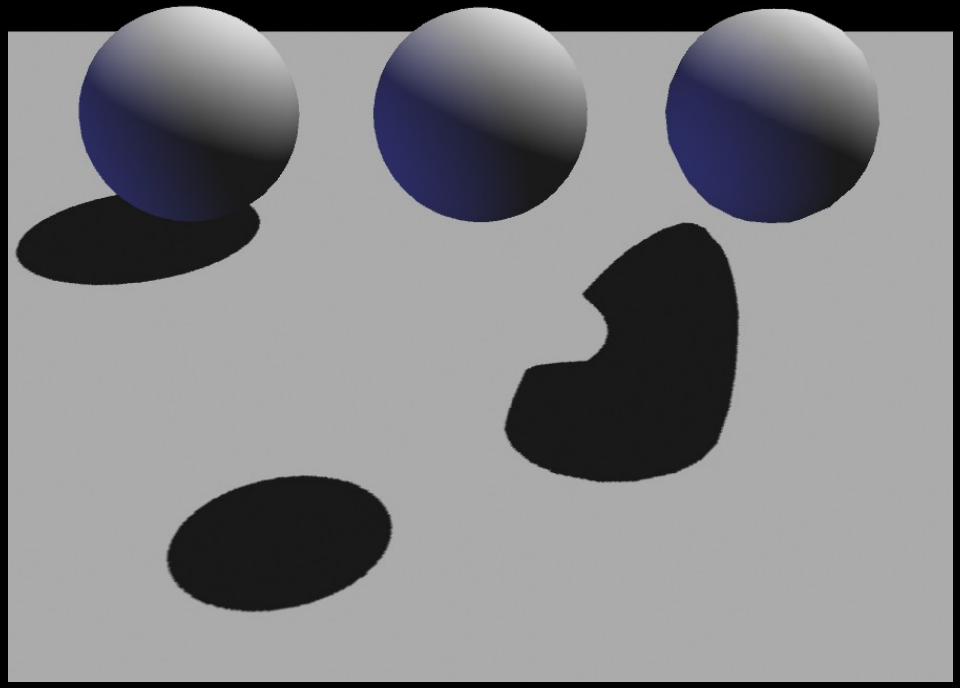
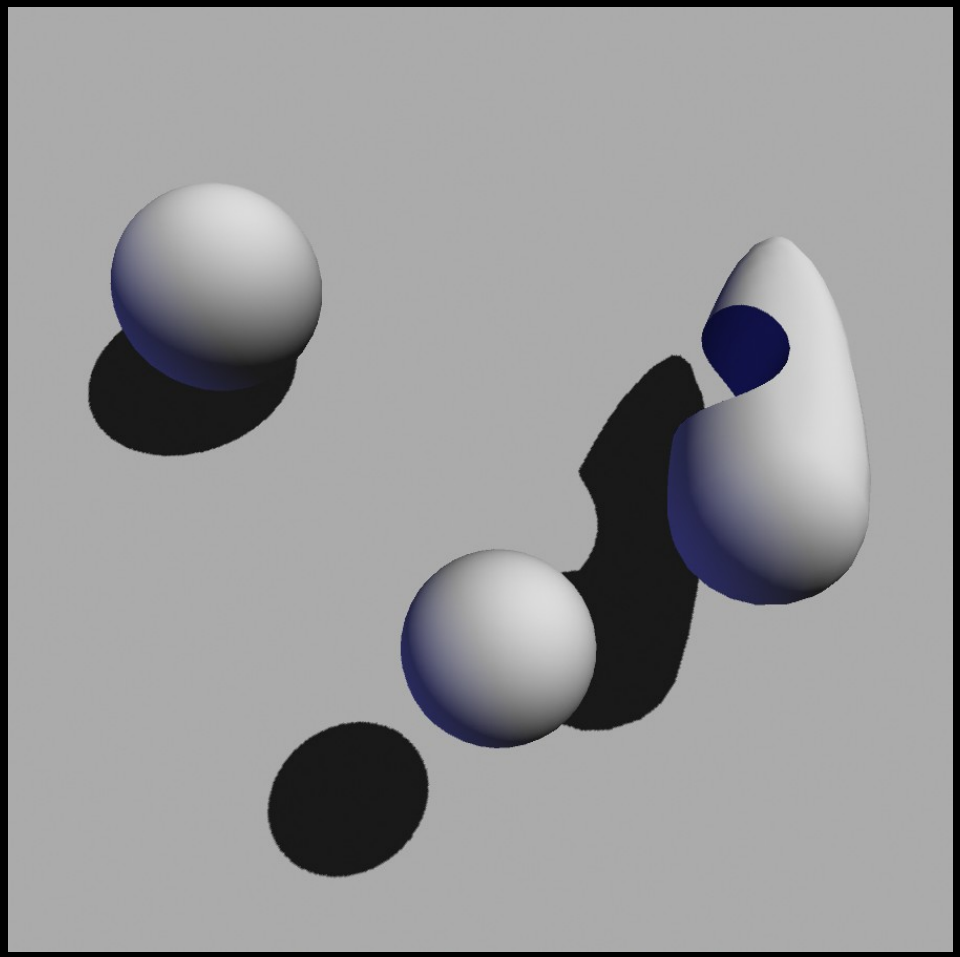
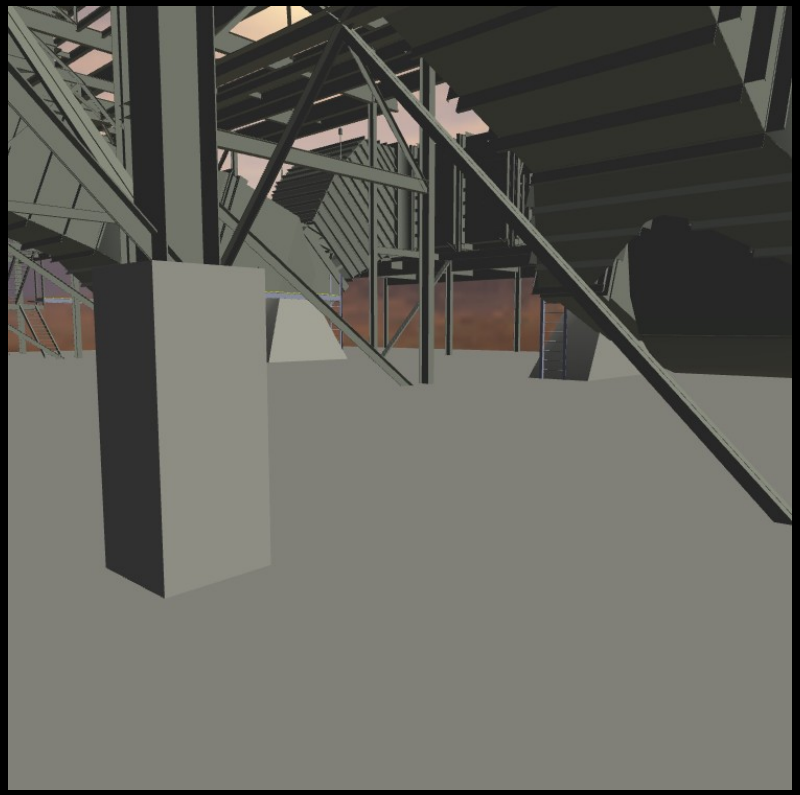
Importance of Shadows



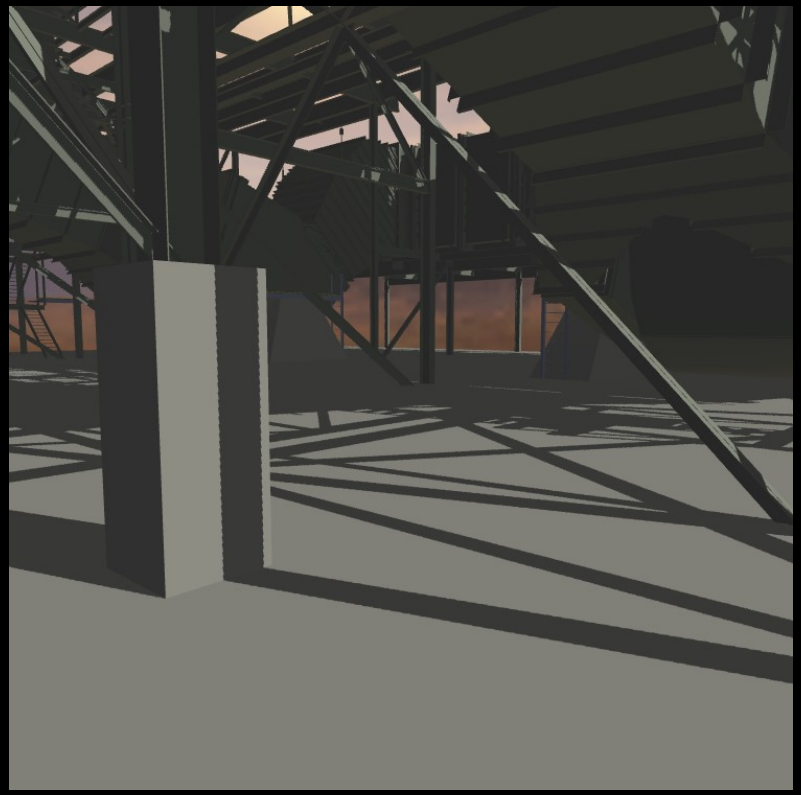
Importance of Shadows



Importance of Shadows



Without shadows



With shadows

Source: UNC

Utility of Shadows

- **Main limitation:**
  - Our screen is 2D while the real world is 3D.

- We have lots of ways to *fake* three-dimensionality.
  - Depth
  - Perspective
- Create the illusion of 3D on a 2D screen.

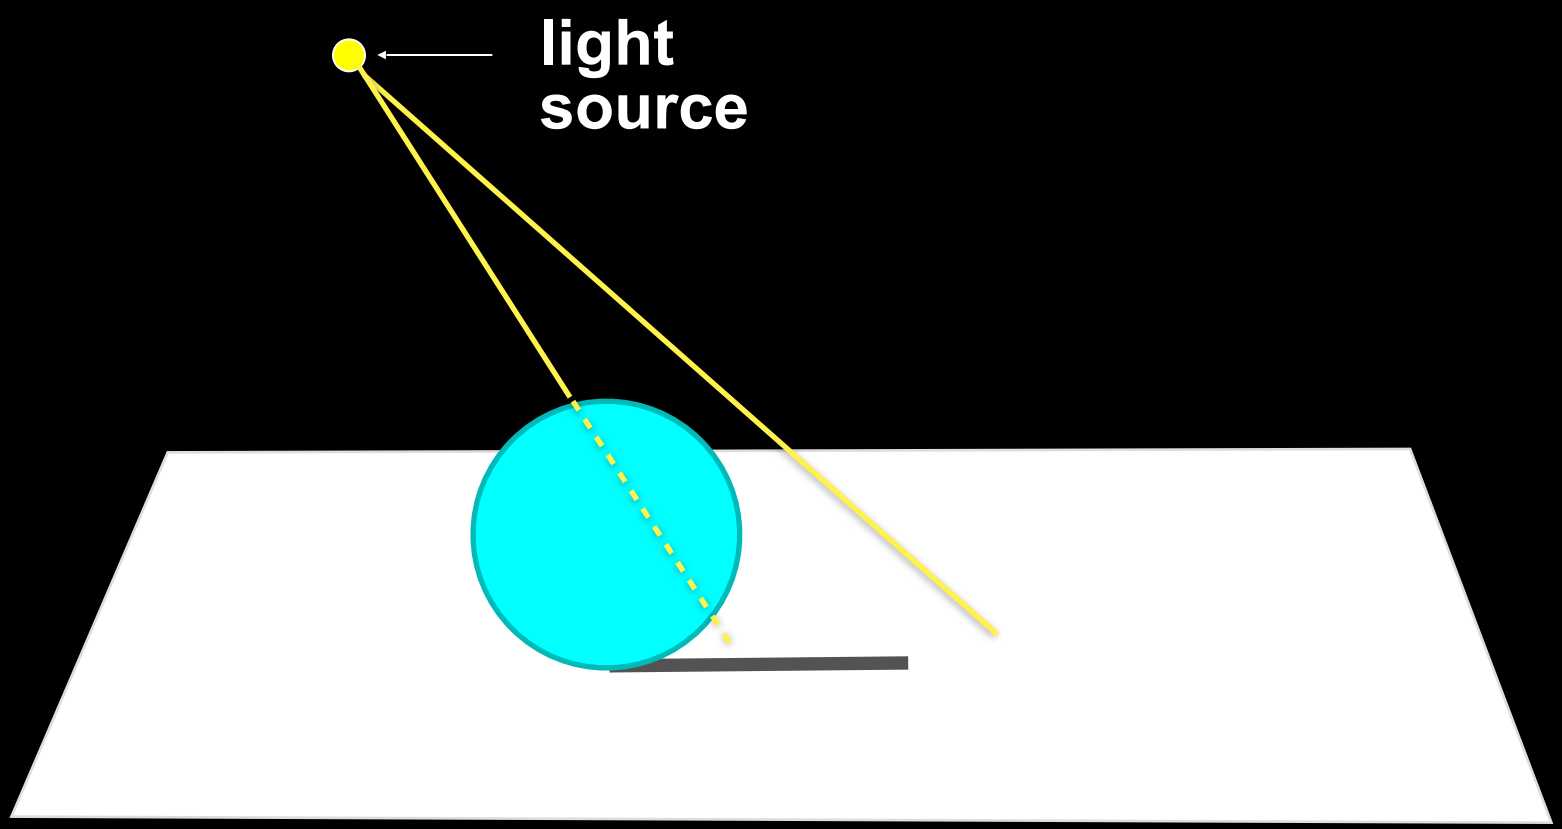
- Shadows are an important tool in this toolkit.

Doom III

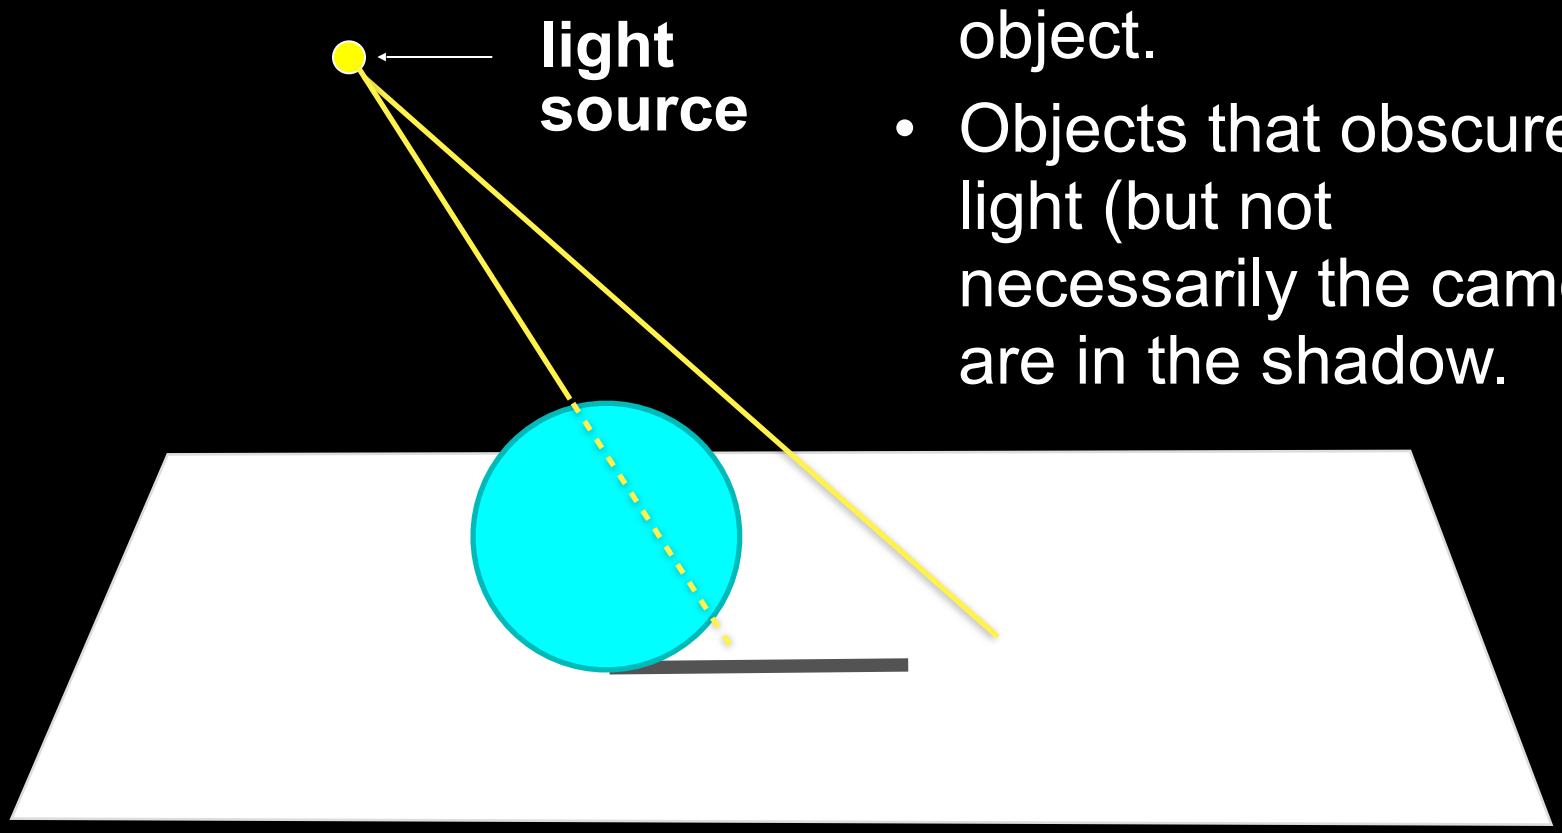
Source: Wikipedia

Reported to spend 50% of time rendering shadows!

How are Shadows Defined?

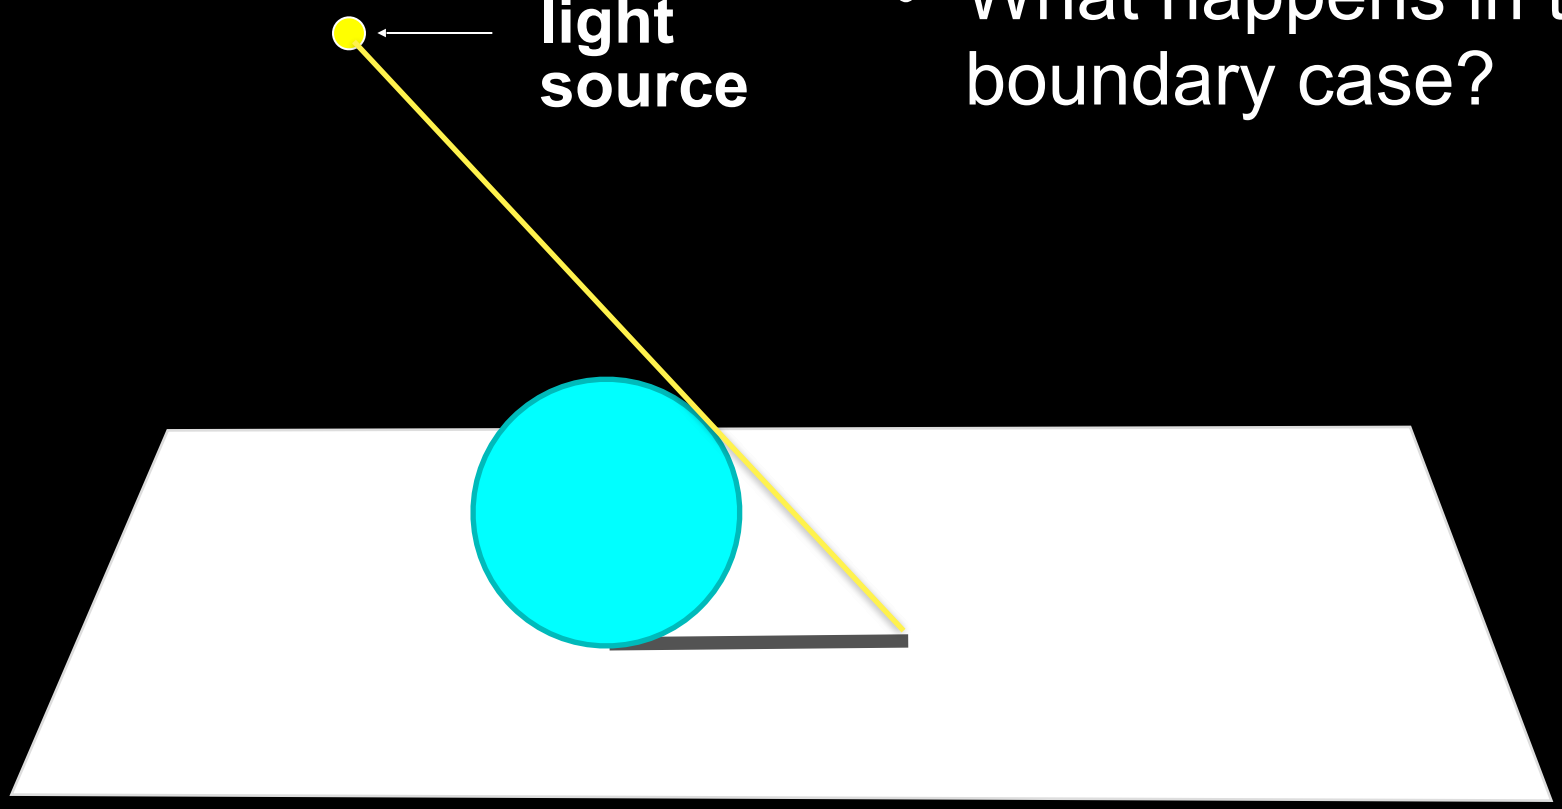


How are Shadows Defined?



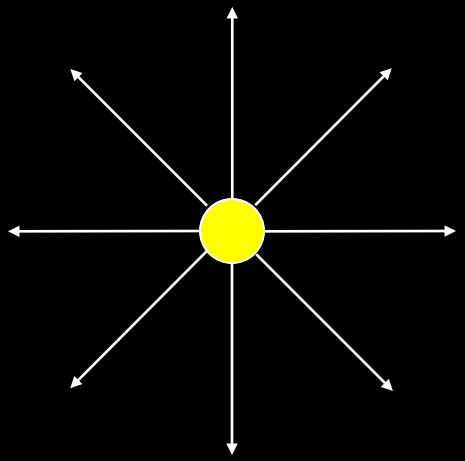
- A light source illuminates every object.
- Objects that obscure a light (but not necessarily the camera) are in the shadow.

How are Shadows Defined?

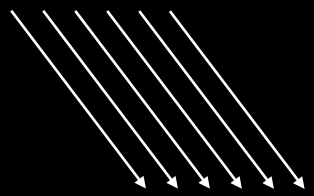


- What happens in this boundary case?

Light sources



point
light source



directional

Hard shadow

Soft shadow

Hard and soft shadows

Blender demo

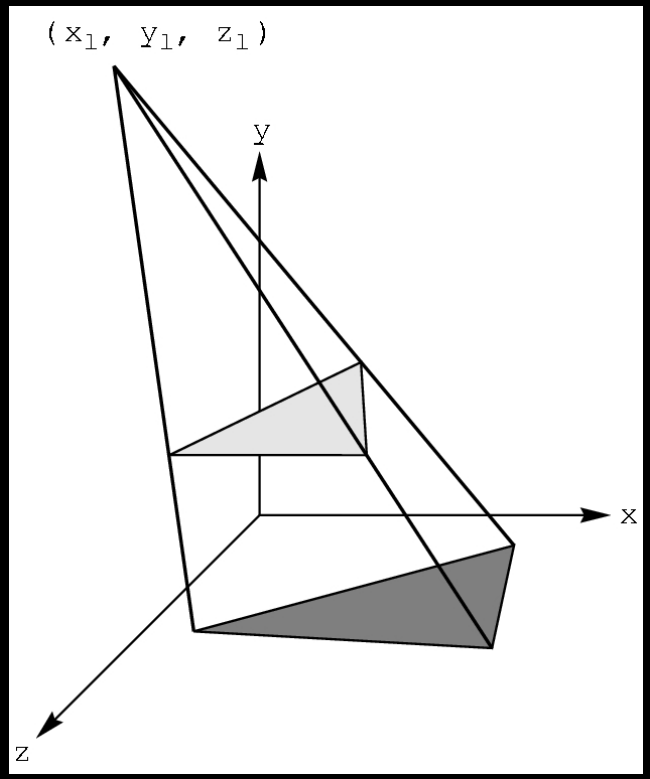
Shadow Algorithms

- With visibility tests
  - Accurate yet expensive
  - Example: ray casting or ray tracing
    - physical ideal
  - Example: 2-pass z-buffer
    [Foley, Computer Graphics: Principles and Practice, Ch. 16.4.4]

- Without visibility tests (“fake” shadows)
  - Approximate and inexpensive
  - Using a model-view matrix “trick”

Projection-based Shadows

- Assume light source at $[x_l \;\; y_l \;\; z_l]^T$
- Assume shadow on plane y = 0
- Construct a modelview matrix to flatten the geometry onto the shadow plane



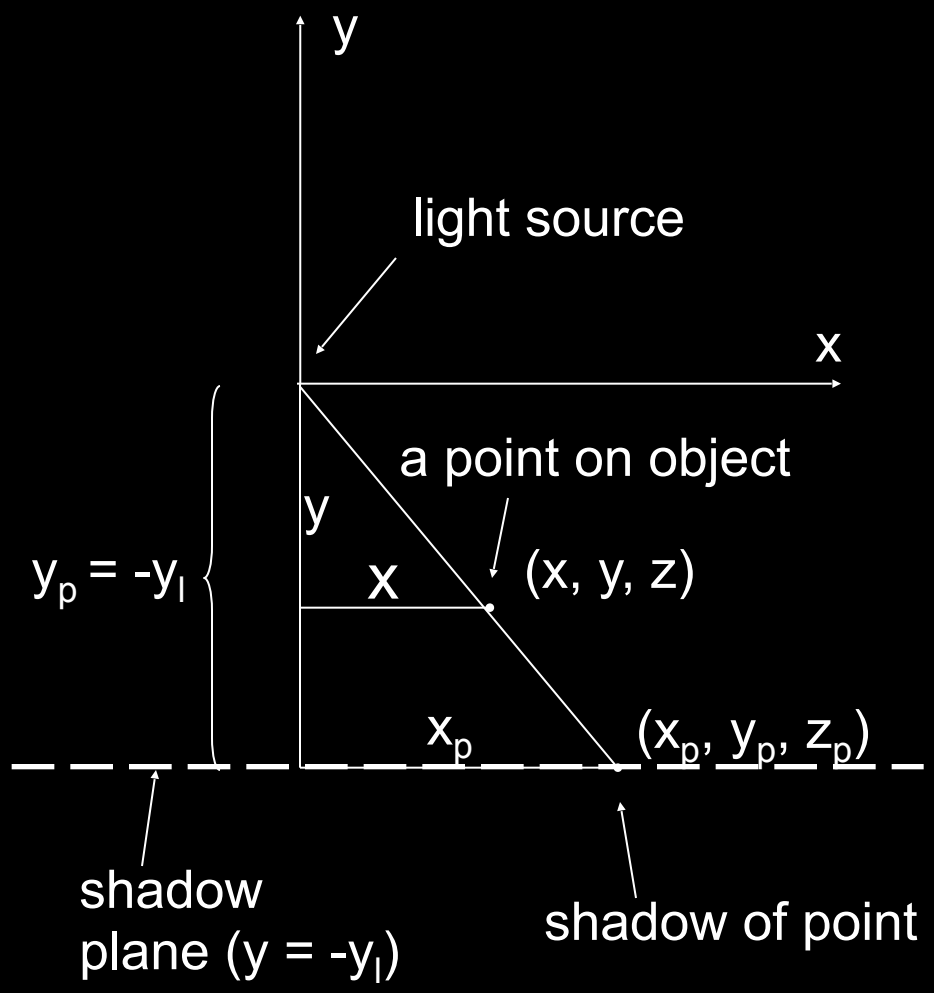
Shadow Projection Strategy

- Move light source to origin
- Apply appropriate projection matrix
- Move light source back
- Instance of general strategy: compose complex transformation from simpler ones!

$$T = \begin{bmatrix} 1 & 0 & 0 & -x_l \\ 0 & 1 & 0 & -y_l \\ 0 & 0 & 1 & -z_l \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

Derive Equation

- Now, light source at origin



$$\frac{x_p}{y_p} = \frac{x}{y} \qquad \text{(see picture)}$$

$$y_p = -y_l \qquad \text{(move light)}$$

$$x_p = \frac{x}{y} y_p = -\frac{x}{y} y_l$$

$$z_p = \frac{z}{y} y_p = -\frac{z}{y} y_l$$

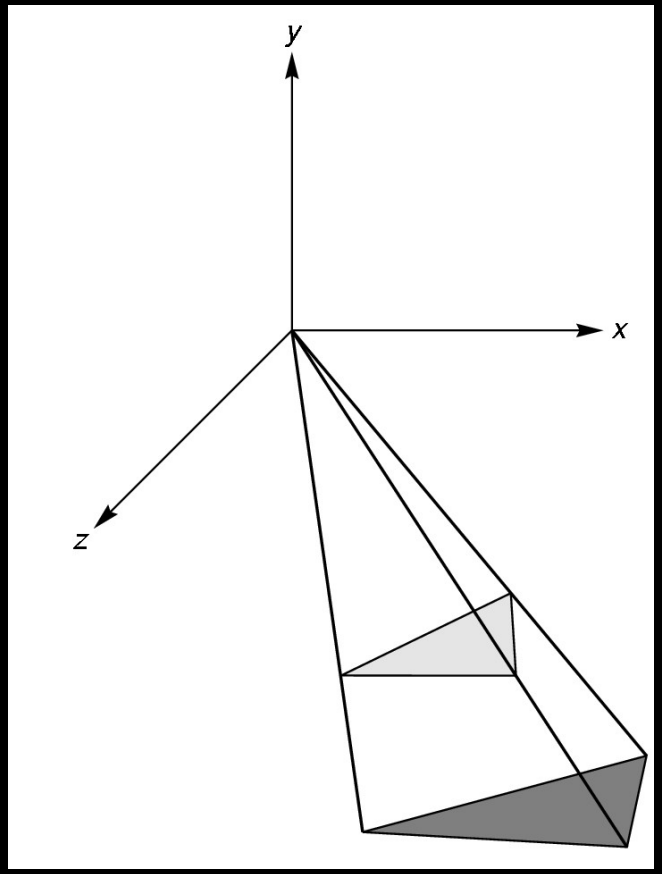
Light Source at Origin

- After translation, solve

$$M \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = w \begin{bmatrix} -\frac{xy_l}{y} \\ -y_l \\ -\frac{zy_l}{y} \\ 1 \end{bmatrix}$$

- w can be chosen freely
- Use $w = -y / y_l$

$$M \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x \\ y \\ z \\ -\frac{y}{y_l} \end{bmatrix}$$



Shadow Projection Matrix

- Solution of previous equation

$$M = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & -\frac{1}{y_l} & 0 & 0 \end{bmatrix}$$

- Total shadow projection matrix

$$S = T^{-1}MT = \ldots$$

Implementation

- Recall column-major form

```
GLfloat m[16] =
{1.0, 0.0, 0.0, 0.0,
  0.0, 1.0, 0.0, -1.0 / yl,
  0.0, 0.0, 1.0, 0.0,
  0.0, 0.0, 0.0, 0.0};
```

- yl is light source height
- Assume drawPolygon(); draws object

Saving the ModelView Matrix State

- Assume xl, yl, zl hold light coordinates
- Core OpenGL code (compatibility code is similar)

```
openGLMatrix.MatrixMode(OpenGLMatrix::ModelView);
// here, set the model view matrix, in the usual way
// …

drawPolygon();     // draw normally
openGLMatrix.PushMatrix();     // save current matrix
openGLMatrix.Translate(xl, yl, zl);       // translate
back
openGLMatrix.MultMatrix(m);          // project
openGLMatrix.Translate(-xl, -yl, -zl);  // move light to
origin

float ms[16];
openGLMatrix.GetMatrix(ms); // read the shadow matrix
```

Saving the ModelView Matrix State (cont.)

```
// upload the shadow matrix to the GPU
pipelineProgram->SetUniformVariableMatrix4fv(
        "modelViewMatrix", GL_FALSE, ms);

drawPolygon();     // draw polygon again for shadow

// restore original modelview matrix
openGLMatrix.PopMatrix();
openGLMatrix.GetMatrix(ms);
pipelineProgram->SetUniformVariableMatrix4fv(
        "modelViewMatrix", GL_FALSE, ms);

// continue rendering more objects, as usual …
```

The Matrix and Attribute Stacks

- Mechanism to save and restore state
  - `{OpenGLMatrix::, gl}PushMatrix();`
  - `{OpenGLMatrix::, gl}PopMatrix();`
  - Remember how stacks work?
- Apply to current matrix
- In compatibility profile, can also save current attribute values
  - Examples: color, lighting
  - `glPushAttrib(GLbitfield mask);`
  - `glPopAttrib();`
  - Mask determines which attributes are saved
  - This feature has been removed in the core profile

Drawing on a Surface

- Shimmering ("z-buffer fighting") when drawing shadow on surface
- Due to limited precision of depth buffer
- Solution: slightly displace either the surface or the shadow

  (`glPolygonOffset` in OpenGL)

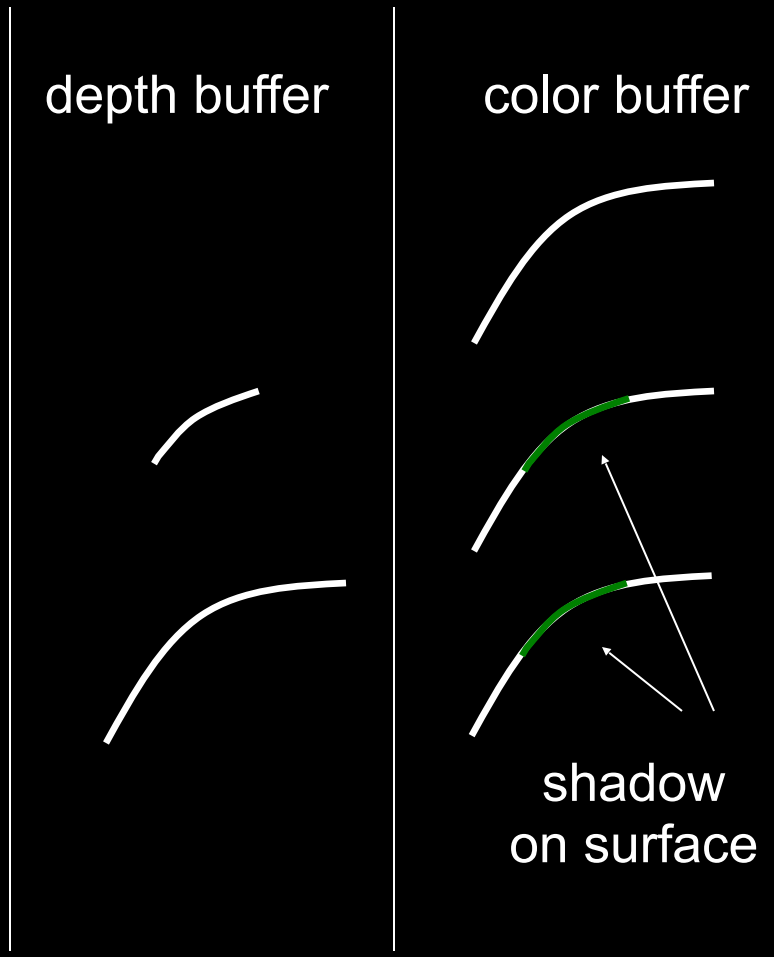
z-buffer fighting

no z-buffer fighting

Drawing on a Surface

Or use general technique

1. Set depth buffer to read-only, draw surface
2. Set depth buffer to read-write, draw shadow
3. Set color buffer to read-only, draw surface again
4. Set color buffer to read-write

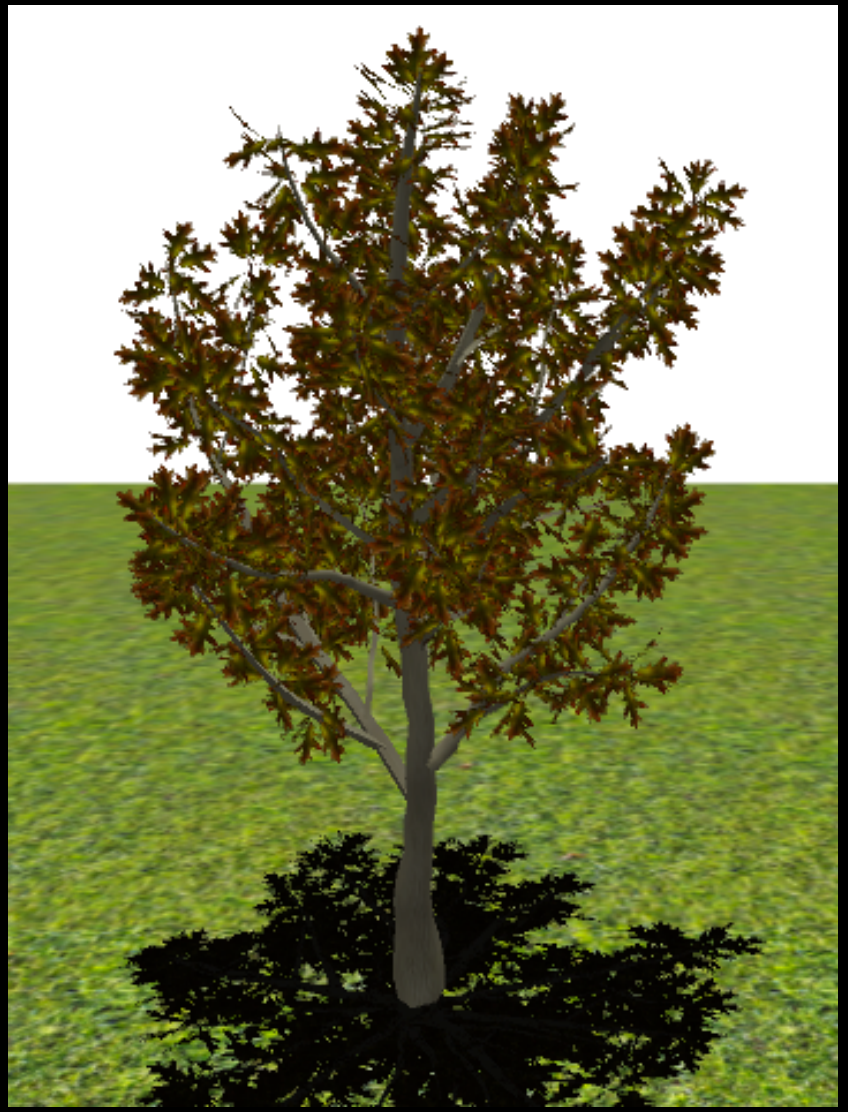


Outline

- Projections and Shadows
- Hierarchical Models

Hierarchical Models

- Many graphical objects are structured
- Exploit structure for
  - Efficient rendering
  - Example: tree leaves
  - Concise specification of model parameters
  - Example: joint angles
  - Physical realism
- Structure often naturally hierarchical



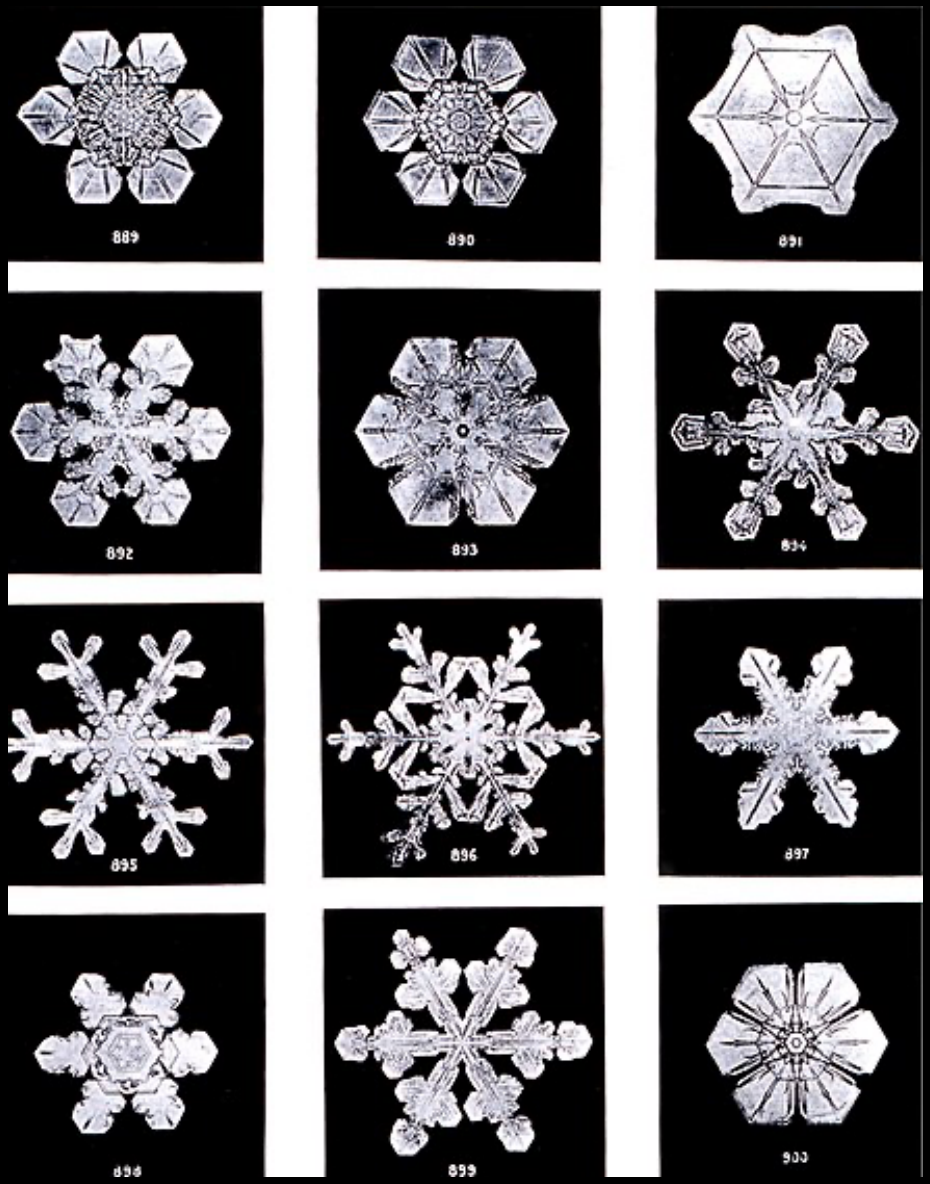
Hierarchical Models

- Crowds of background characters

https://www.youtube.com/watch?v=xWq-ZPMhai8

Hierarchical Models

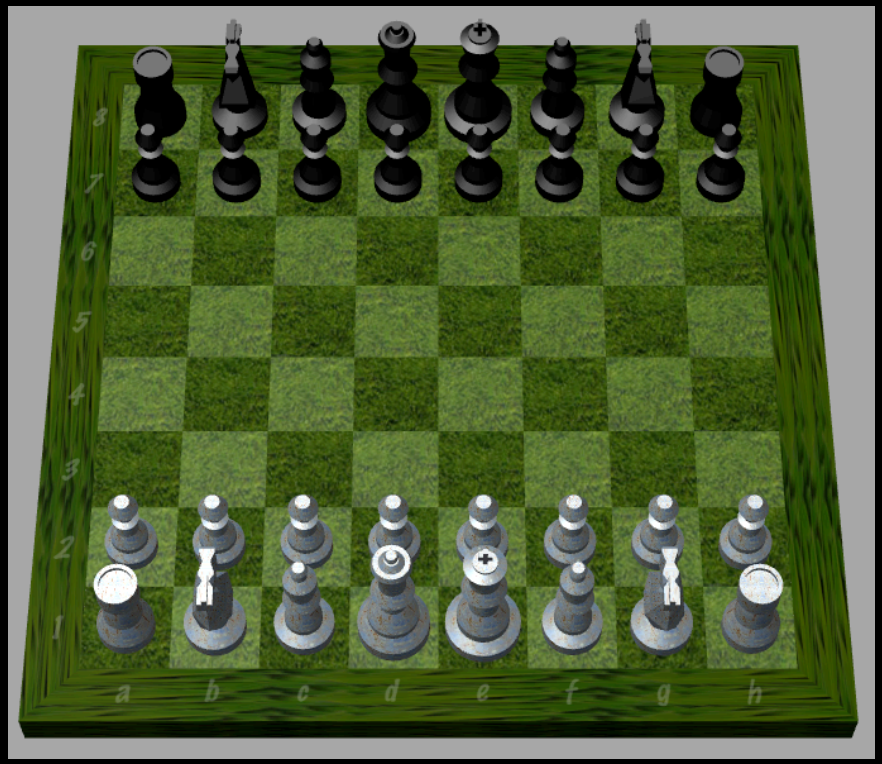
- Snowflakes



https://commons.wikimedia.org/wiki/File:SnowflakesWilsonBentley.jpg

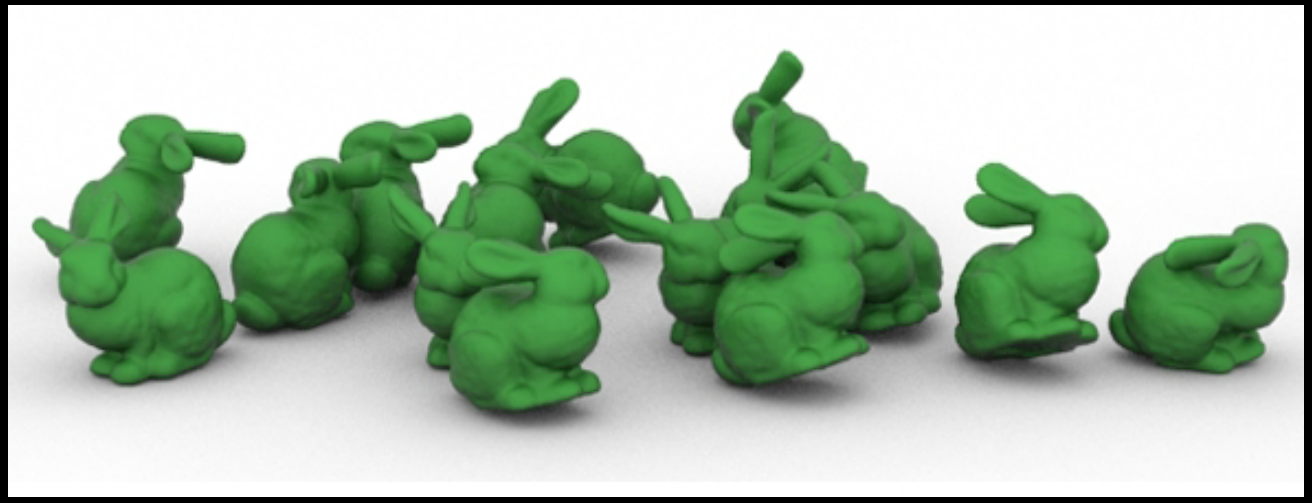
Instance Transformation

- Often we need several instances of an object
  - Wheels of a car
  - Arms or legs of a figure
  - Chess pieces



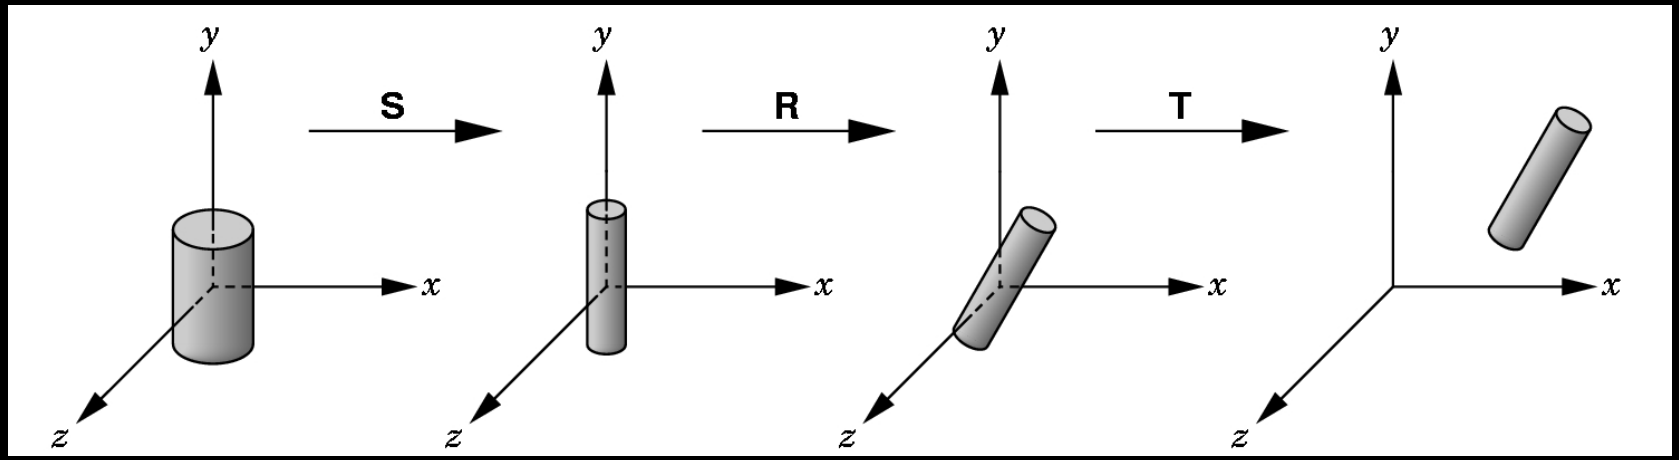
Instance Transformation

- Instances can be shared across space or time
- Write a function that renders the object in “standard” configuration
- Apply transformations to different instances
- Typical order: scaling, rotation, translation



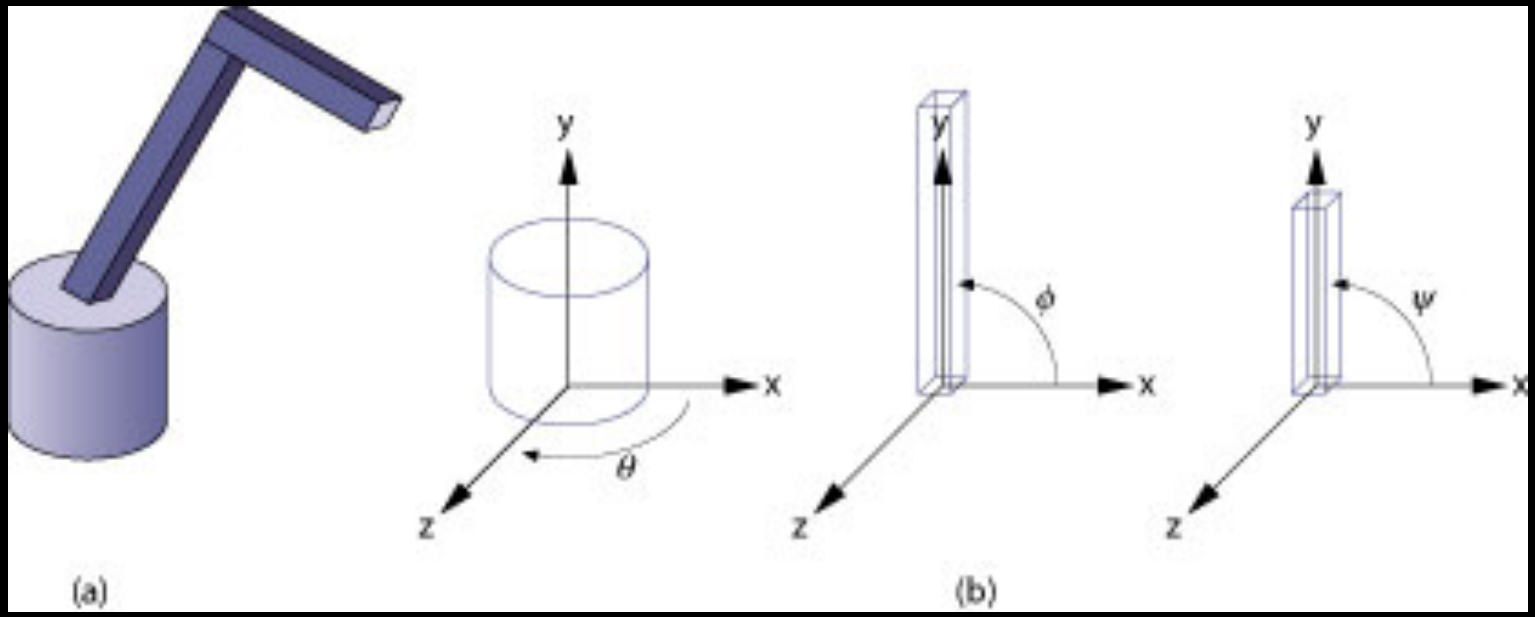
Sample Instance Transformation

```
openGLMatrix.MatrixMode(OpenGLMatrix::ModelView);
openGLMatrix.LoadIdentity();
openGLMatrix.Translate(...);
openGLMatrix.Rotate(...);
openGLMatrix.Scale(...);
// … upload modelview matrix to GPU, as usual …
renderCylinder(...);
```



Drawing a Compound Object

- Example: simple “robot arm”

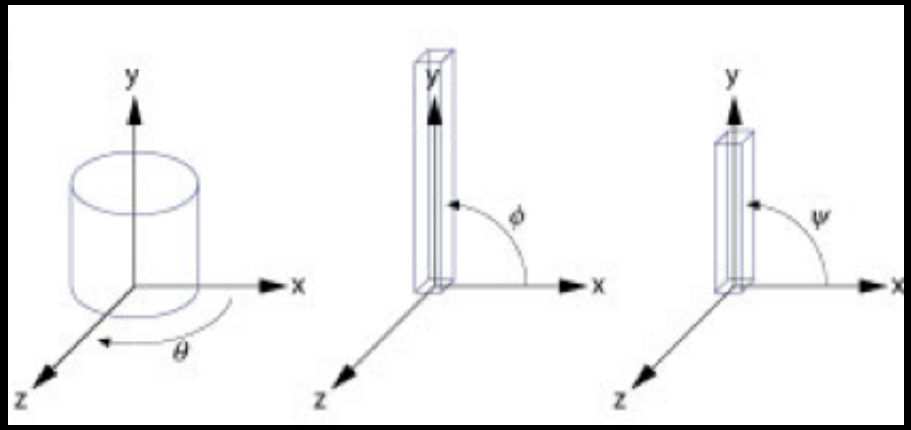


Base rotation θ, arm angle ϕ, joint angle ψ

Hierarchical Objects and Animation

- Drawing functions are time-invariant and draw the object in a canonical position:

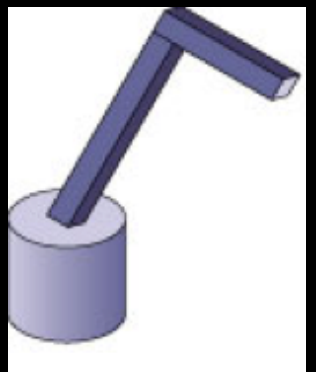
  drawBase(); drawLowerArm(); drawUpperArm();
- Can be easily stored in a VBO
- Change parameters of model with time

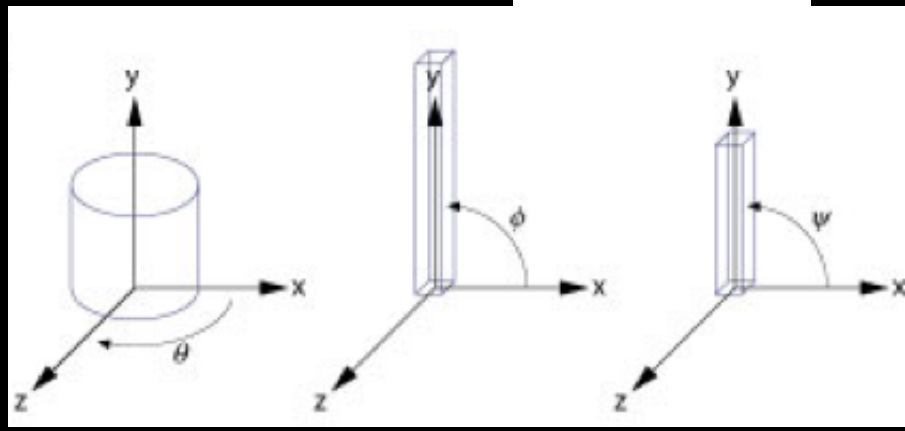


Interleave Drawing & Transformation

- h1 = height of base, h2 = length of lower arm
- This is pseudocode (must upload matrix to GPU)

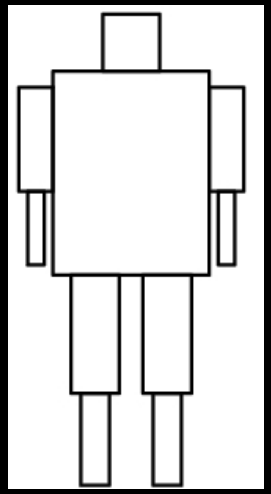
```
void drawRobot(GLfloat theta,
   GLfloat phi, GLfloat psi)
{
    Rotate(theta, 0.0, 1.0, 0.0);
    drawBase();
    Translate(0.0, h1, 0.0);
    Rotate(phi, 0.0, 0.0, 1.0);
    drawLowerArm();
    Translate(0.0, h2, 0.0);
    Rotate(psi, 0.0, 0.0, 1.0);
    drawUpperArm();
}
```

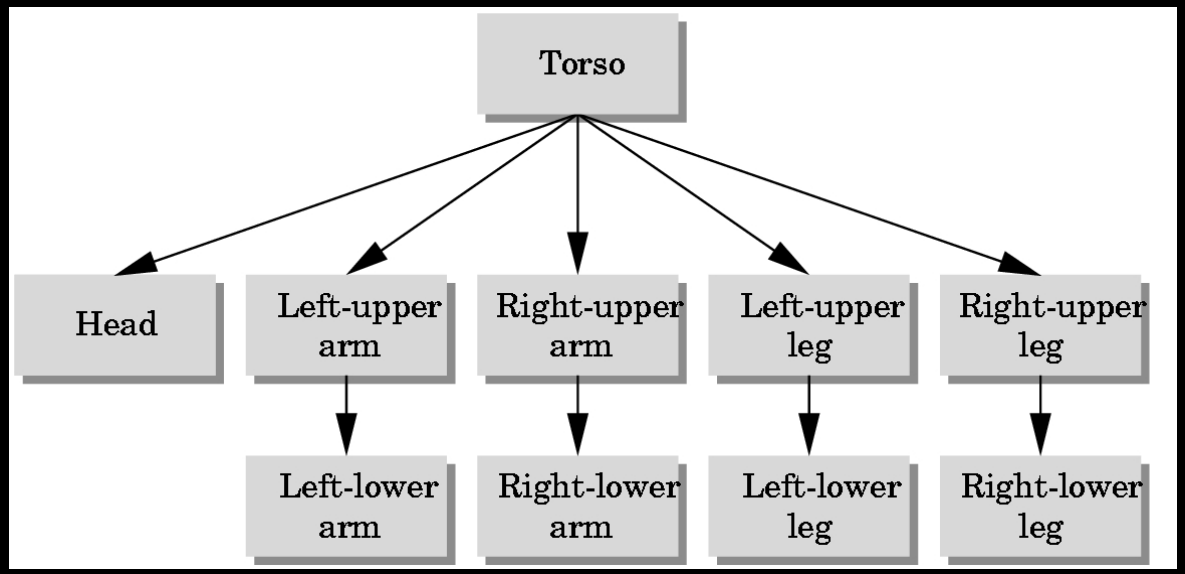




More Complex Objects

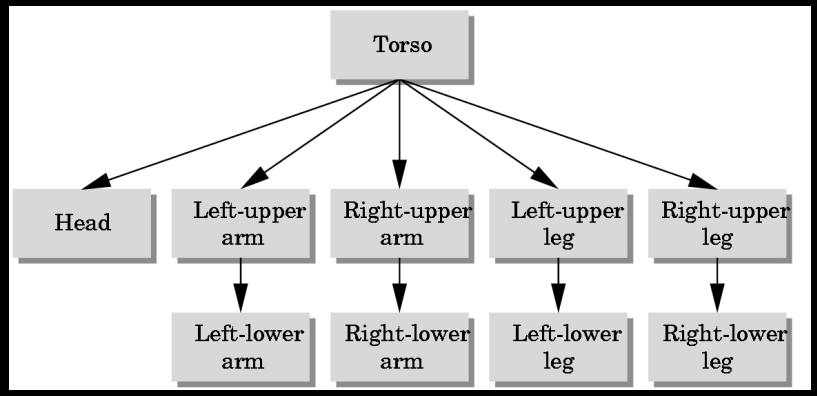
- Tree rather than linear structure
- Interleave along each branch
- Use push and pop to save state
  - (from our helper code)
  - why is a stack the right tool here?





Hierarchical Tree Traversal

- Order not necessarily fixed (breadth-first, depth-first, etc.)
- Example:



```
void drawFigure()
{
  PushMatrix();  // save
  drawTorso();
  Translate(...); // move head
  Rotate(...);     // rotate head
  drawHead();
  PopMatrix();   // restore
  PushMatrix();
```

```
Translate(...);
Rotate(...);
drawLeftUpperArm();
Translate(...)
Rotate(...)
drawLeftLowerArm();
PopMatrix();
... }
```

Using Tree Data Structures

- Can make tree form explicit in data structure

```
typedef struct treenode
{
  GLfloat m[16];
  void (*render) ( );
  struct treenode *sibling;
  struct treenode *child;
} treenode;
```

Initializing Tree Data Structure

- Initializing transformation matrix for node

```
treenode torso, head, ...;
// in init function
LoadIdentity();
Rotate(...);
GetMatrix(torso.m);
```

- Initializing pointers

```
torso.render = drawTorso;
torso.sibling = NULL;
torso.child = &head;
```

Generic Traversal: Recursion

```
void traverse (treenode *root)
{
  if (root == NULL)
    return;
  PushMatrix();
  MultMatrix(root->m);
  root->render();
  if (root->child != NULL)
    traverse(root->child);
  PopMatrix();
  if (root->sibling != NULL)
    traverse(root->sibling);
}
```

Advantages of hierarchical modeling

- Save memory on the GPU
  - Trade-off multiple render passes vs. memory constraints.
  - Allows offloading memory-intensive operations to loading screens.
- Even if hierarchical modeling is purely on CPU, it makes modeling much easier.
- Allows for easy control of complex shapes.
  - Will come in handy for animation later!

Exercise: Legos!

- Legos are the ultimate hierarchical modeling tool.
- Model simple lego bricks as cubes made from triangles
- Assemble, using instancing, Lego toys in your OpenGL world from HW1

Summary

- Projections and Shadows
- Hierarchical Models
